

7.5 HCS08 Instruction Set Summary

Instruction Set Summary Nomenclature

The nomenclature listed here is used in the instruction descriptions in [Table 7-2](#).

Operators

()	=	Contents of register or memory location shown inside parentheses
←	=	Is loaded with (read: “gets”)
&	=	Boolean AND
	=	Boolean OR
⊕	=	Boolean exclusive-OR
×	=	Multiply
÷	=	Divide
:	=	Concatenate
+	=	Add
–	=	Negate (two’s complement)

CPU registers

A	=	Accumulator
CCR	=	Condition code register
H	=	Index register, higher order (most significant) 8 bits
X	=	Index register, lower order (least significant) 8 bits
PC	=	Program counter
PCH	=	Program counter, higher order (most significant) 8 bits
PCL	=	Program counter, lower order (least significant) 8 bits
SP	=	Stack pointer

Memory and addressing

M	=	A memory location or absolute data, depending on addressing mode
M:M + 0x0001	=	A 16-bit value in two consecutive memory locations. The higher-order (most significant) 8 bits are located at the address of M, and the lower-order (least significant) 8 bits are located at the next higher sequential address.

Condition code register (CCR) bits

V	=	Two’s complement overflow indicator, bit 7
H	=	Half carry, bit 4
I	=	Interrupt mask, bit 3
N	=	Negative indicator, bit 2
Z	=	Zero indicator, bit 1
C	=	Carry/borrow, bit 0 (carry out of bit 7)

CCR activity notation

–	=	Bit not affected
---	---	------------------

- 0 = Bit forced to 0
- 1 = Bit forced to 1
- = Bit set or cleared according to results of operation
- U = Undefined after the operation

Machine coding notation

- dd = Low-order 8 bits of a direct address 0x0000–0x00FF (high byte assumed to be 0x00)
- ee = Upper 8 bits of 16-bit offset
- ff = Lower 8 bits of 16-bit offset or 8-bit offset
- ii = One byte of immediate data
- jj = High-order byte of a 16-bit immediate data value
- kk = Low-order byte of a 16-bit immediate data value
- hh = High-order byte of 16-bit extended address
- ll = Low-order byte of 16-bit extended address
- rr = Relative offset

Source form

Everything in the source forms columns, *except expressions in italic characters*, is literal information that must appear in the assembly source file exactly as shown. The initial 3- to 5-letter mnemonic is always a literal expression. All commas, pound signs (#), parentheses, and plus signs (+) are literal characters.

- n* — Any label or expression that evaluates to a single integer in the range 0–7
- opr8i* — Any label or expression that evaluates to an 8-bit immediate value
- opr16i* — Any label or expression that evaluates to a 16-bit immediate value
- opr8a* — Any label or expression that evaluates to an 8-bit value. The instruction treats this 8-bit value as the low order 8 bits of an address in the direct page of the 64-Kbyte address space (0x00xx).
- opr16a* — Any label or expression that evaluates to a 16-bit value. The instruction treats this value as an address in the 64-Kbyte address space.
- opr8* — Any label or expression that evaluates to an unsigned 8-bit value, used for indexed addressing
- opr16* — Any label or expression that evaluates to a 16-bit value. Because the HCS08 has a 16-bit address bus, this can be either a signed or an unsigned value.
- rel* — Any label or expression that refers to an address that is within –128 to +127 locations from the next address after the last byte of object code for the current instruction. The assembler will calculate the 8-bit signed offset and include it in the object code for this instruction.

Address modes

- INH = Inherent (no operands)
- IMM = 8-bit or 16-bit immediate
- DIR = 8-bit direct
- EXT = 16-bit extended

- IX = 16-bit indexed no offset
 IX+ = 16-bit indexed no offset, post increment (CBEQ and MOV only)
 IX1 = 16-bit indexed with 8-bit offset from H:X
 IX1+ = 16-bit indexed with 8-bit offset, post increment (CBEQ only)
 IX2 = 16-bit indexed with 16-bit offset from H:X
 REL = 8-bit relative offset
 SP1 = Stack pointer with 8-bit offset
 SP2 = Stack pointer with 16-bit offset
